Ans to Q No - 1

a) Each character needs 1 byte.

$\therefore$  5 characters need 5 bytes,

So, in 1 slot there are  $(5 \times 8) = 40$  bits.

$\therefore$  in 7 slots there are  $(40 \times 7)$  bits  
 $= 280$  bits.

(Ans)

b) Output frame rate = Input rate.

$$= (75 \div 5) \times 10^6 = 15000000 \text{ frames/second.}$$

c) Output data rate = frame rate  $\times$  frame size

$$= (15000000 \times 280) \text{ bits/s}$$

$$= 525 \text{ MB/s}$$

$$d) \text{ Input bit duration} = \frac{1}{\text{input rate}}$$

$$= \frac{1}{15000000} \text{ seconds}$$

$$= 66.6667 \text{ nanoseconds}$$

(Ans)

$$e) \text{ Output bit duration} = \frac{\text{Input bit duration}}{\text{number of connections}}$$

$$= \frac{66.6667}{7} \text{ nanoseconds}$$

$$= 9.524 \text{ nanoseconds.}$$

[Approx]

$$f) \text{ Output slot duration} = 9.524 \text{ nanoseconds.}$$

[Approx]

## Ans to Q No-2

i) After encoding using 4B/5B, 10010111111010

becomes  $\rightarrow$  11110111000111010101,

Using MLT-3 scheme:

ii) ~~Given~~, Using HDB3

Ans to Q No-3

a) Unshielded twisted-pair cables,

b) Twisted pair cables,

c) Optical Fiber
